QUALITY IMPROVEMENT
PROGRAM

“Real Time Risk Adjustment”, July 29, 2014

**Mark E. Cohen, PhD
Continuous Quality Improvement
American College of Surgeons**

The Real Time Application

This application allows participants to get risk- and shrinkage-adjusted “projected” odds ratios, with confidence intervals, for determination of outlier status, for:

- 100 Essential models.
- With user-specified time ranges and time intervals.

What does “Real Time” mean?

While we are providing “real time” risk- and shrinkage-adjusted outcomes... must be very careful to understand just what that means.

In the previous presentation we saw what is involved in our modeling process. It takes about 6-8 weeks to move data from the Quintiles database to our internal tables, clean data, run 197 hierarchical models, and construct and post reports.

How can this be done in real time?

What does “Real Time” mean?

The simple answer is that... what you may think that the “Real Time” application is doing, may not be what the “Real Time” application actually is doing.

We are not modeling in real time; we are applying models in real time.

We are using parameters from historical models, with extra-modeling shrinkage, to approximate what the (odds ratio) results from actual, contemporaneous, hierarchical models would look like - hence “projected”.

How do we get a projected odds ratio?

- We begin with an historical logistic model (which accounts for patient and procedure risk) for each outcome
- Two essential shortcuts:
 - Fixed predictor set
 - 18 models or outcomes (not 100), followed by case filters
- When a case is complete, we use the logistic equations to generate a predicted probability (E) for each outcome
- When a “request” comes in:
 - we sum the Os and Es for the requested grouping of cases (e.g., by specialty and time interval) – yielding a real time O/E ratio
 - We apply a transformation to the logistic model O/E ratio so that it looks like an hierarchical model odds ratio – a “projected” odds ratio

“Real time” and the SAR/ISAR gold standard

Our “real time” application is limited to what we’ve determined to be a stable and well-studied set of outcomes based on the Essential models.

In addition, we will continue to provide the “gold standard” SAR/ISAR modeling results (not all vendors do this).

From a programmatic perspective, we believe that the ACS NSQIP approach of providing Real Time plus SARs/ISARs represents having the best of both worlds.

Data used in Real Time versus SAR/ISAR

		Standard SAR/ISAR Data Processing				Real Time Application
DAY	NOTES	Index Surgery Date by Quarter				
Day 0	Date of index operation	Jan 1- Mar31	Apr1- June30	July 1- Sept 30	Oct 1- Dec 31	Any Date
POD1= Index Date +1day						
POD30 until Midnight	Postop Event Follow-up Ends					
POD60	(Completed)					(Available)
POD90	(Completed)					(Available)
POD120 (Four Months)	Data lock					Available
POD150						Available
POD180 (Six Months)	POD 180-269	1 st ISAR- October	1 st SAR- January	1 st ISAR- April	1 st SAR- July	Available
POD210						Available
POD240						Available
POD270 (Nine Months)	POD 270-359	1 st SAR- January	1 st ISAR- April	1 st SAR- July	1 st ISAR- October	Available
POD300						Available
POD330						Available
POD360 (12 Months)	POD 360-449	2 nd ISAR- April	2 nd SAR- July	2 nd ISAR- October	2 nd SAR- January	Available
POD390						Available
POD420						Available
POD450 (15 Months)	POD 450-539	2 nd SAR- July	2 nd ISAR- October	2 nd SAR- January	2 nd ISAR- April	Available
POD480						Available
POD510						Available
POD540 (18 Months)	Case exits SAR reporting	Gone	Gone	Gone	Gone	Available
Beyond		(overtime)	(overtime)	(overtime)	(overtime)	Available...

The Real Time Application

This application permits hospitals to monitor risk-and shrinkage-adjusted changes in performance over time, in real time, and to anticipate profiling results as they would be reported in forthcoming SARs and ISARS.

- Monitor effects of QI initiatives
- Detect emergent quality issues
 - Both of these as adjuncts to control charts
- Anticipate SAR/ISAR performance

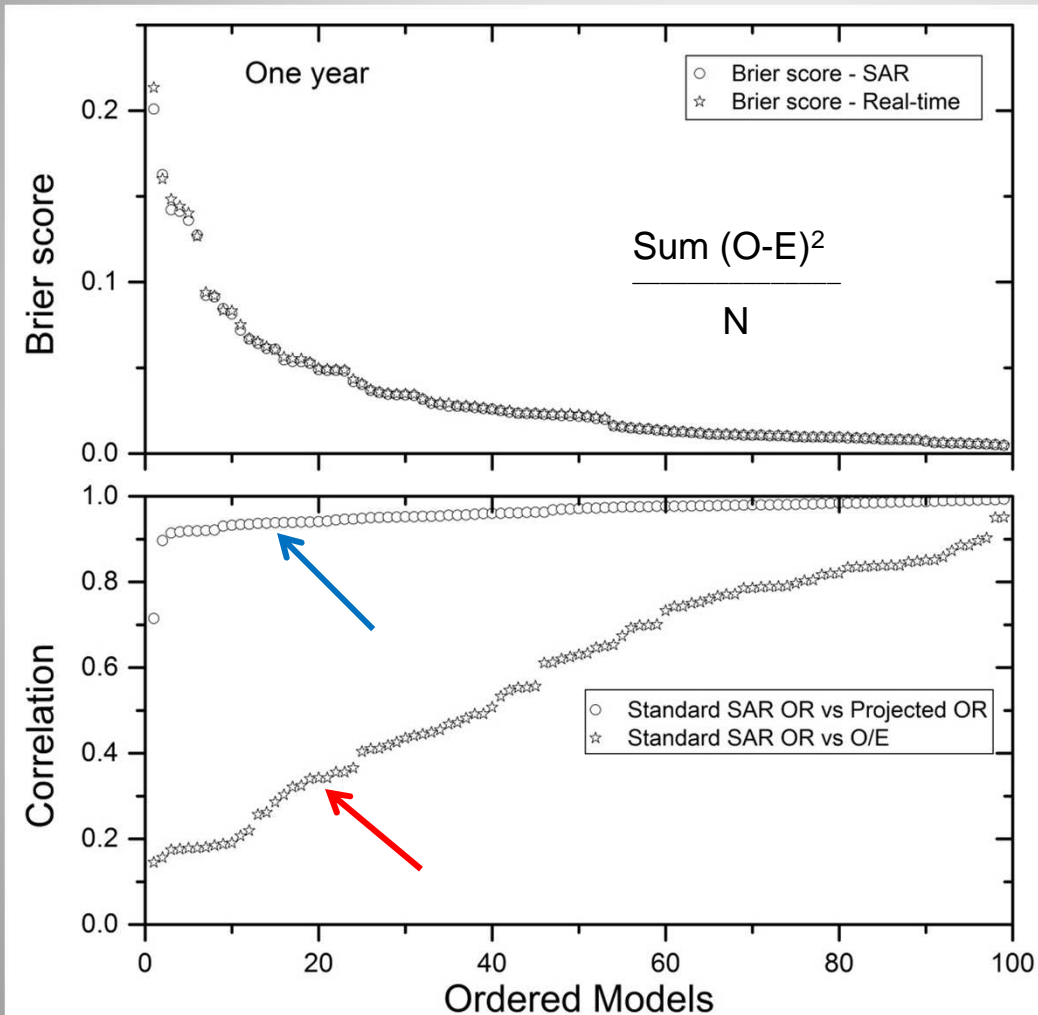

The Real Time Application - Performance

There are many reasons why real time projected odds ratios might be dissimilar to those from SAR and ISAR odds ratios.

- The data included in a particular real time date range may not be the same as in a SAR or ISAR date range.
- Criteria for eligible cases have changed over time (Ns will be different).
- Real time models use a different predictor set than used for SAR and ISAR models.
- Real time uses 18 global models plus filters rather than 100 individual models
- The real time model parameters are built from several years of data; these parameters will be different from those estimated for any SAR or ISAR period.
- Projected odds ratios are estimated by transforming logistic model O/E ratios. There is no mathematical expectation that these projected odds ratios will be identical to SAR or ISAR hierarchical model odds ratios

... So how close are projected odds ratios to standard SAR/ISAR odds ratios? Are they close enough to be useful?

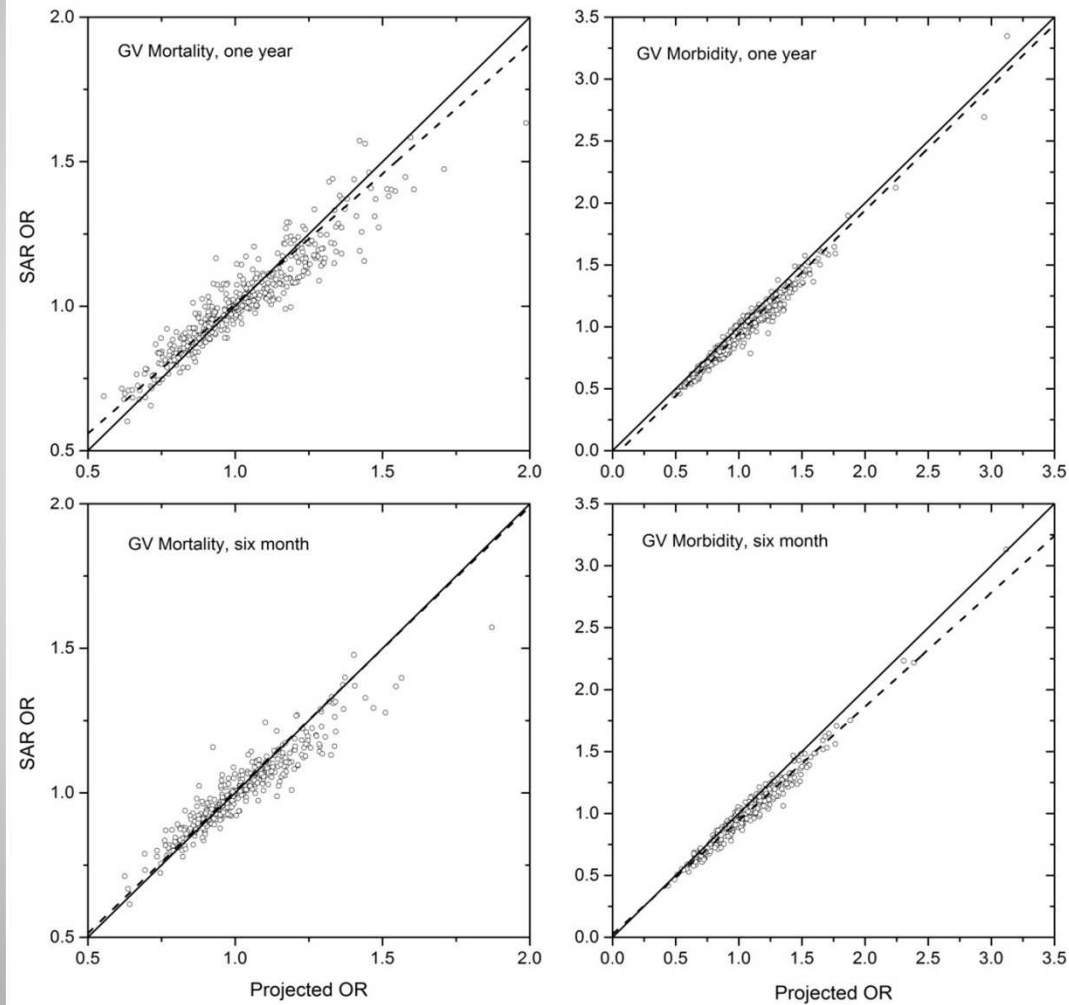

The Real Time Application - Performance

Values close to 0 are best

Values close to 1 are best

The Real Time Application - Performance

The Real Time Application - Performance

The Real Time Application - Performance

Not all models will look this good. Projected odds ratios for models with smaller N will tend to be less consistent with subsequent SAR/ISAR odds ratios.

The Real Time Application

The screenshot displays a web browser window with the URL `http://acs-chi-cq11-8080/RTRWeb/demo/`. The browser's address bar shows the page title "ACS NSQIP - Real-Time Ris...". The browser's menu bar includes "File", "Edit", "View", "Favorites", "Tools", and "Help". The browser's toolbar includes "Convert" and "Select".

The application interface features a dark blue header with the ACS NSQIP logo on the left and the text "AMERICAN COLLEGE OF SURGEONS National Surgical Quality Improvement Program" on the right. The header also includes links for "Contact Us" and "Logout". Below the header is a navigation bar with tabs for "ACS NSQIP MAIN PAGE" (selected) and "DATA PORTAL". The "ACS NSQIP MAIN PAGE" tab is further divided into "Home", "Reports", "SCR Toolbox", and "Documents".

Below the navigation bar is a status bar displaying the following information: "Current Study: Adult", "Current User: Test User", "Site: Test Site", "Site ID: 98765", "Account Info: My Profile", and "My Hospital".

The main content area is titled "Real-Time Risk and Shrinkage-Adjusted Projected Odds Ratio Report" and includes a "Data Snapshot Date: 04/01/2014". Below the title is a form with the following fields:

- Model:** A dropdown menu with "GV Mortality" selected.
- From:** A dropdown menu.
- To:** A dropdown menu.
- Time Interval:** A dropdown menu with "Quarterly" selected.
- Run Report:** A red button.

The Real Time Application

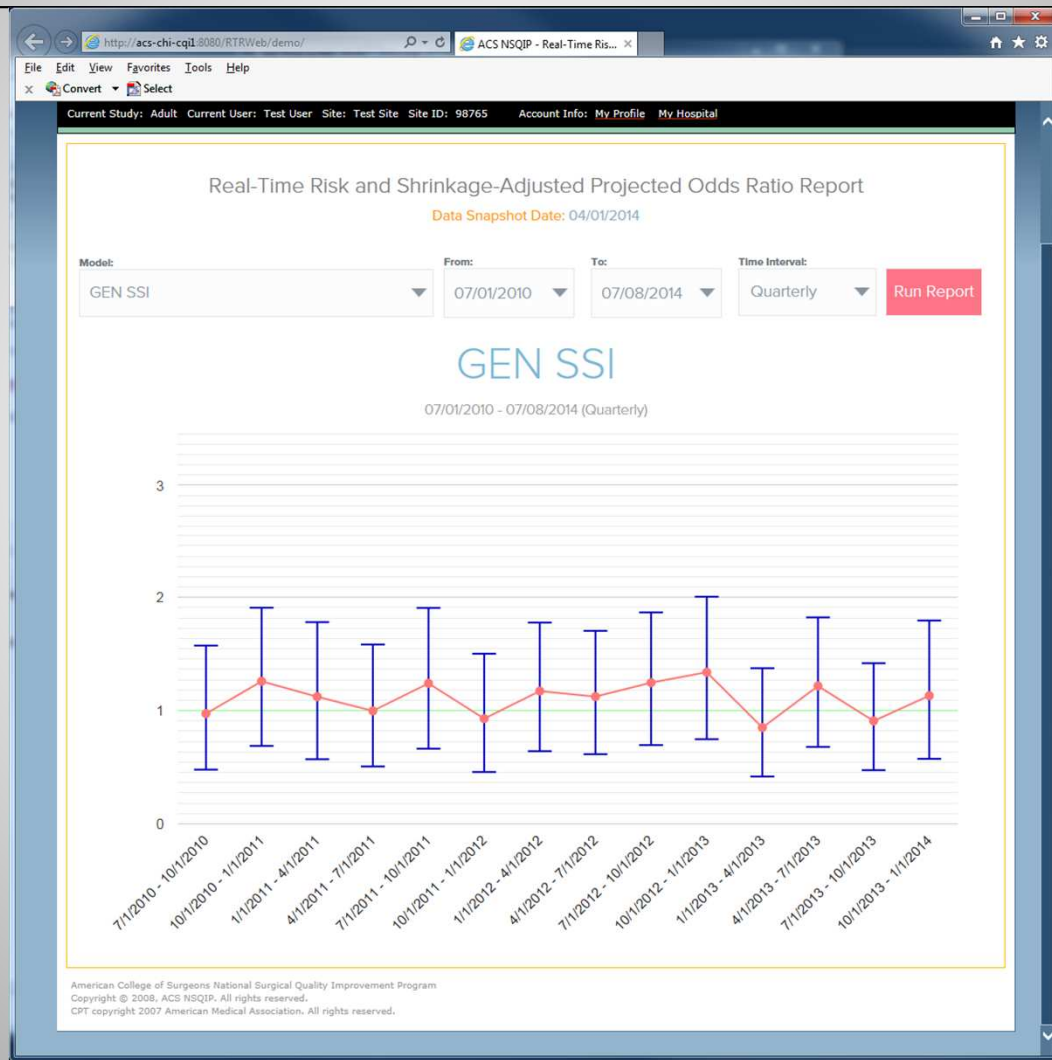

The screenshot displays the ACS NSQIP Real-Time Risk Application interface. The browser address bar shows the URL <http://acs-chi-cqil6080/RTRWeb/demo/>. The application header includes the ACS NSQIP logo, the text "AMERICAN COLLEGE OF SURGEONS National Surgical Quality Improvement Program", and links for "Contact Us" and "Logout". A navigation bar contains "ACS NSQIP MAIN PAGE" and "DATA PORTAL". Below this, a user profile section shows "ID: 98765" and "Account Info: My Profile My Hospital".

A dropdown menu is open on the left side, listing various surgical sites and complications. The categories are:

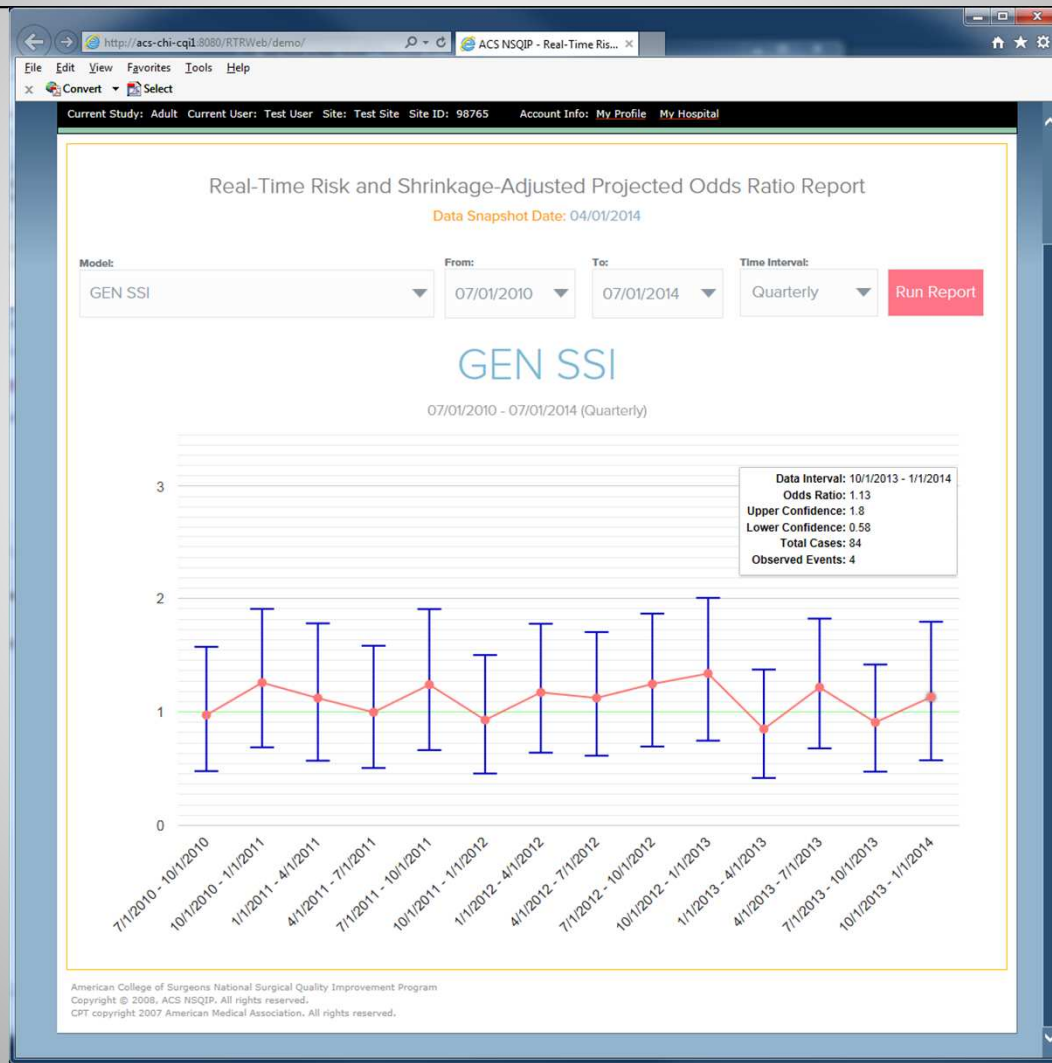

- GV DVT/PE
- GV Renal Failure
- GV UTI
- GV SSI
- GV ROR
- General
 - GEN Mortality
 - GEN Morbidity
 - GEN Cardiac
 - GEN Pneumonia
 - GEN Unplanned Intubation
 - GEN Ventilator > 48 Hours
 - GEN DVT/PE
 - GEN Renal Failure
 - GEN UTI
- GEN SSI (highlighted)
- GEN ROR
- Colorectal
 - COLORECT Mortality
 - COLORECT Morbidity
 - COLORECT Length-of-Stay
 - COLORECT UTI
 - COLORECT SSI
 - COLORECT ROR
- Vascular
 - VASC Mortality
 - VASC Morbidity
 - VASC Cardiac
 - VASC Pneumonia
 - VASC UTI

The main content area displays the "Package-Adjusted Projected Odds Ratio Report". Below the title, the "Data Snapshot Date" is "04/01/2014". A form for generating the report includes fields for "From:" (07/08/2014), "To:" (07/01/2010), and "Time Interval:" (Quarterly). A red "Run Report" button is located to the right of the "Time Interval" field.
